2 Symbols, Abbreviations and Acronyms

The same Symbols, Abbreviations and Acronyms as in the SRS, the TestPlan and the MG (available in STEM Moiré GPA repository) are used in the Module Interface Specifications document.

Contents

3 Introduction

The following document details the Module Interface Specifications for STEM Moiré GPA. The full documentation and implementation can be found in STEM Moiré GPA repository.

4 Notation

The structure of the MIS for modules comes from [?], with the addition that template modules have been adapted from [?]. The mathematical notation comes from Chapter 3 of [?]. For instance, the symbol $:=$ is used for a multiple assignment statement and conditional rules follow the form $(c_1 \Rightarrow r_1 | c_2 \Rightarrow r_2 | ... | c_n \Rightarrow r_n)$.

The following table summarizes the primitive data types used by STEM Moiré GPA.

Data Type	**Notation**	**Description**
character	char	a single symbol or digit
integer	$\mathbb{Z}$	an integer number
natural number	$\mathbb{N}$	a natural number
real	$\mathbb{R}$	a real number

The specification of STEM Moiré GPA uses some derived data types: sequences, strings, and tuples. Sequences are lists filled with elements of the same data type. Strings are sequences of characters. Tuples contain a list of values, potentially of different types. In addition, STEM Moiré GPA uses functions, which are defined by the data types of their inputs and outputs. Local functions are described by giving their type signature followed by their specification.

5 Module Decomposition

The following table is taken directly from the Module Guide document for this project.

Level 1	**Level 2**
Hardware-Hiding Module	
Behaviour-Hiding Module	Input STEM Moiré GPA Control STEM Moiré GPA GUI User Input SMH simulation GPA Mask Unstrained region Conversion 2D strain tensor

6.4 Semantics

STEM Moiré GPA is designed to have the different steps of the process flow driven by user directly through GUI_SMG. The STEM Moiré GPA Control Module uses the events in STEM Moié GPA GUI to use the processing modules in the order defined by the user.

load_files(pathISMH,pathIC):

- transition: pathISMH and pathIC are the file paths for the input files. The following procedure is performed:
  1. The .dm3 files are read and their respective metafiles are collected.
  2. From the metafile, $I_{SMH_{\text{exp}}}$, $I_{C_{\text{ref}}}$, p and p_{ref} are extracted to modify their respective state variable.
  3.
  4. The variables $I_{SMH_{\text{exp}}}$, $I_{C_{\text{ref}}}$, p and p_{ref} are stored in the data structure using the access program store
