3 General Information

3.1 Purpose

The purpose of the document is to provide the plan for testing STEM Moiré GPA software.

3.2 Scope

3.3 Overview of Document

4 Plan

4.1 Software Description

STEM Moiré GPA software is converting STEM Moiré hologram into deformation maps. Details on the goal and the requirements of STEM Moiré GPA are provided in the Problem Statement and the SRS documents. Acronyms, symbols and terminologies used in the following document are the same as the ones in the SRS document.

4.2 Test Team

The author is the only member of the test team.

4.3 Automated Testing Approach

While interesting to implement, the automatic testing is not approached in STEM Moiré GPA program.

4.4 Verification Tools

4.5 Non-Testing Based Verification

5 System Test Description

Because the GPA method is itself based on a approximation (see IM 2 in SRS document), errors from the algorithm are added to the errors from the code. Both are probed at the same time and cannot be fully separated. Therefore, to interpret the various 2D array errors generated from the test functions Test 3, Test 4, the error will be characterized as a function of the mask properties (such as radius) and the deformation magnitude. This characterization will allow STEM Moiré GPA to be compared with other software using the same GPA algorithm.

$$-\forall \overrightarrow{r} \in \mathbb{I}, \ E_{\Delta \overrightarrow{g}_{j \text{cor}}^{M_{\text{exp}}}} = ||\Delta \overrightarrow{g}_{j \text{cor}}^{M_{\text{exp}}t}||$$

Test 6 is more representative of a real case than Test 5 and will be use to characterize the evolution of the error with respect to the level of noise and the size of U. The evaluation of $\overrightarrow{g}_{\text{uns}}^{M_{\text{exp}}}$ is critical on the quantitative estimation of strain and rotation.
