3 Introduction

The following document details the Module Interface Specifications for STEM Moiré GPA. The full documentation and implementation can be found in STEM Moiré GPA repository.

4 Notation

The structure of the MIS for modules comes from [1], with the addition that template modules have been adapted from [2]. The following table summarizes the primitive data types used by STEM Moiré GPA.

Data Type	Notation	Description
character	char	a single symbol or digit
integer	\mathbb{Z}	an integer number
$_{ m natural}$	\mathbb{N}	a natural number
real	\mathbb{R}	a real number
image	\mathbb{I}	blabla

The specification of STEM Moiré GPA uses some derived data types: sequences, strings, and tuples. Sequences are lists filled with elements of the same data type. Strings are sequences of characters. Tuples contain a list of values, potentially of different types. In addition, STEM Moiré GPA uses functions, which are defined by the data types of their inputs and outputs. Local functions are described by giving their type signature followed by their specification.

5 Module Decomposition

The following table is taken directly from the Module Guide document for this project.

6.4 Semantics

STEM Moiré GPA is designed to have the process flow driven by user directly through GUI_SMG. The STEM Moiré GPA Control Module uses the events in STEM Moié GPA GUI to use the processing modules in the order defined by the user.

6.4.1 State Variables

None

6.4.2 Access Routine Semantics

main():

• transition:

GUIFlow() # Software permanently running until user abort it by closing the GUI GUI Conv() # Open the entry field GUI for the conversion process

If one of the event below is triggered by the user, an action is performed by STEM Moiré GPA. The possible events are :

- (event_Input() → Get the path pathISMH and pathIC from the user → load_files(pathISMH,pathIC)) → GUI_SMHexp())
- (event_SimSMH() →
 SMHsim(load(ISMHexp), load(ICref), load(pISMHexp), load(pICref)
 → GUI SMHsim())
- For each GUI object mask M_j with $j = \{1, 2\}$ drawn by the user in the of GUI_SMHsim() window:
 - 1. (event_GPA() \rightarrow gpa(load(FTISMHexp), collect_circ(M_j), id(M_j)) \rightarrow GUI_Phase())
 - 2. (event_URef() \rightarrow ZeroStrain(load_g(id(M_j))(deltagM), load_g(id(M_j))(gMuns), collect_rect(U), id(M_j)) \rightarrow update GUI_Phase())
 - 3. (event_Conversion() \rightarrow Read the *n* and *m* entry fields in GUI_Conv \rightarrow conversion(load g(id(M_i))(pISMHexp), load g(id(M_i)(gMuns)), id(M_i))
- (event_StrainCalc() \rightarrow CalcStrain(load(id(M_1), gCuns), load(id(M_2), gCuns), load(id(M_1), deltagM), load(id(M_2), deltagM)) \rightarrow GUI_Strain())
